

## Deploy the Application on the docker Machine:

---

### 1.Download the image (Web application)

Sudo docker pull <image name>

### 2.To see the all images

Sudo docker images

### 3a. for changing the port or specifying a port number is

Sudo docker run -d --name <new image name> -p <port number> <original image name>

3.See the port number first port (:8080 ( This is host port )->80/tcp,(this is default port) so we want to change the default port number to host port number . so we change 80 to 8080

4. Go to Security groups change the port number to 8080 and give custom tcp save rule

5.copy the Public dns ipv4 and past that url on the browser with port number 8080.
