Create Our Own Docker Image :-

1.sudo mkdir <directory name>

      Create one directory

2.sudo nano <filename>

      Create one file name anything you want (e.g dockerfile)

3.sudo nano <filename>

      Create another file anything (e.g readmefile)

4.sudo nano dockerfile<file name u specified>

      Add the content here FROM ubuntu (from is the base image where we extract)

               CMD ["Hello" , "hii"] (execute the content)

5.sudo docker build -t <image name> .

      (if want to add tag you can specify like this docker build -t my_image:v1)

6.sudo docker images

      You can see your images
